

A Multifaith Space

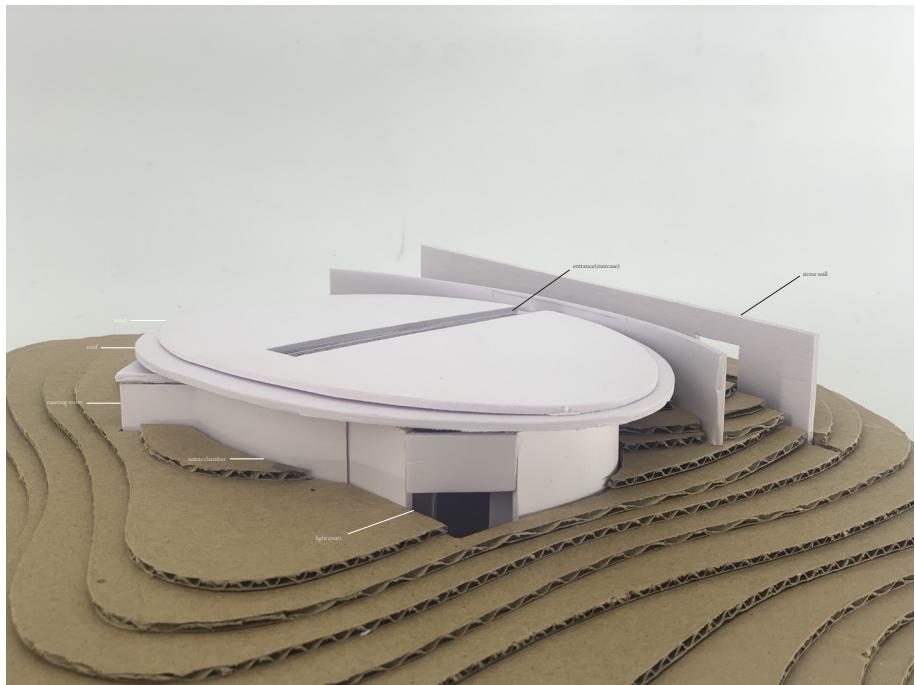

My project is about providing space for the multiple faiths found throughout the Sanyang Wetlands. Because of government planning, most religious buildings in the Sanyang Wetland will be demolished. My proposal therefore gives form to the displaced religious communities that have traditionally occupied the Wetlands for generations by building a multifaith space adjacent to the West Gate. The building is built underground, and has a continuous entrance in the form of a staircase running along its perimeter. The roof is full of water which creates a beautiful interior lighting condition that does not characterize one religion over the other. The hollow roof allows sunlight to pass through water, forming beautiful light spots, and creating space through the light beams inside the building, creating a sacred atmosphere and celebrates the role that water plays in each religion. This is made possible by providing a space for religious ritual based around the role that water plays in each religion and can be shared across many religions. Inside the building are empty rooms where people can pray or do other things. There is also a space for display cabinets, where people can put some religious clothes or items in the display cabinets.
